Problem – Solution Fit Template

1. CUSTOMER SEGMENT(S)

Citizens who need to report and track civic issues, and civic administrators and agents who manage, assign, and resolve complaints.

2. JOBS-TO-BE-DONE / PROBLEMS

Citizens need to securely register complaints, provide issue details, and track complaint status. Administrators and agents need to view, prioritize, assign, update, and resolve complaints efficiently.

3. TRIGGERS

Difficulty in reporting civic issues and tracking their progress; administrative bottlenecks while managing and assigning multiple complaints.

4. EMOTIONS: BEFORE / AFTER

Before: Frustrated by unclear complaint processes and lack of status updates.

After: Confident with transparent tracking and timely complaint updates.

5. AVAILABLE SOLUTIONS

Traditional complaint systems, offline complaint registration, phone-based reporting, and manual complaint tracking.

6. CUSTOMER CONSTRAINTS

Requires a web browser, internet connection, and user registration. The system requires Node.js, npm dependencies, and a MongoDB database for development and deployment.

7. BEHAVIOUR

Users interact with the React-based web interface, while the application communicates with backend REST APIs for authentication, complaint management, assignment, and status updates.

8. CHANNELS OF BEHAVIOUR

8.1 ONLINE: React web application, browser-based dashboards, and REST API services.

8.2 OFFLINE: Local development environment and terminal commands such as npm run dev.

9. PROBLEM ROOT CAUSE

Traditional civic complaint systems lack centralized complaint management, role-based access, transparent status tracking, and efficient coordination between citizens, administrators, and agents.

10. YOUR SOLUTION

CivicCare: A MERN-based civic complaint management system that provides secure authentication, role-based dashboards, complaint registration, assignment, priority management, status tracking, and centralized administration.
